Festivo SLI Document

Festivo is a party planning application which is designed to assist users in the organization of events, managing guest information, and coordinating event details. To provide a reliable experience, it is important to establish measurable standards for how well the application performs. Service Level Indicators (SLIs), Service Level Objectives (SLOs), and Service Level Agreements (SLAs) help define and evaluate these standards.

SLIs specifically are used to measure the application's performance, while SLOs establish the target the team aims to achieve. SLAs on the other hand define formal service commitments and any consequences if those commitments are not met. For Festivo, the team will focus on application availability and the freshness of event information to help ensure that users can access the platform and receive updated event details in a timely manner.

2.0 Service Level Indicators (SLIs)

Service Level Indicators (SLIs) are measurable values used to evaluate how well an application is performing. For Festivo, SLIs will help the team monitor the reliability of the platform and determine whether users are receiving accurate and updated event information. The team has identified two main indicators: availability and information freshness.

2.1 Availability

Availability measures the percentage of time that Festivo is accessible and functioning properly. Since users rely on the application to organize events, manage guest lists, and access important event details, it is important that the platform remains available when needed.

Availability will be measured by monitoring whether the application successfully responds to requests during a defined measurement period.

Availability (%) = (Successful availability checks / Total availability checks) × 100

2.2 Information Freshness

Information freshness measures how quickly changes made by event organizers are reflected on the pages viewed by guests. This includes updates to event dates, locations, schedules, and other important event details.

Information freshness will be measured by tracking the time between an organizer saving an update and that change appearing on the guest-facing page.

Information Freshness (%) = (Updates reflected within 30 seconds / Total event information updates) × 100

These indicators will allow the Festivo team to evaluate the application's reliability and monitor whether important event information is being delivered to users in a timely manner.

Service Level Objectives (SLOs)

Service Level Objectives (SLOs) are specific performance targets that define the level of service an application is expected to achieve. While SLIs measure the actual performance of a system, SLOs establish the goals that the team aims to meet. For Festivo, the team has identified two primary objectives focusing on application availability and information freshness.

3.1 Availability Objective

Festivo aims to maintain an availability rate of at least 99%. This objective is intended to ensure that users can reliably access the application to create events, manage guest lists, and view important event information.

The team will evaluate availability using the percentage of successful availability checks recorded during the measurement period. If availability falls below 99%, the team will investigate the cause and determine what improvements are necessary to restore reliable service.

SLO Target: Maintain at least 99% application availability.

3.2 Information Freshness Objective

Festivo aims to ensure that at least 95% of event information updates are reflected on guest-facing pages within 30 seconds of being saved by an event organizer. This objective helps ensure that guests receive updated information about event schedules, locations, and other important details without unnecessary delays.

The team will measure this objective during each sprint by comparing the time an organizer saves an event update with the time that update becomes visible to guests. Updates that take longer than 30 seconds will count as unsuccessful measurements for this objective.

SLO Target: At least 95% of event information updates must appear on guest-facing pages within 30 seconds, measured each sprint.

3.3 Summary of Service Level Objectives

Service Level Indicator	Service Level Objective	Measurement
Availability	At least 99% uptime	Percentage of successful availability checks
Information Freshness	At least 95% of updates reflected within 30 seconds	Percentage of event updates meeting the 30-second requirement, measured each sprint

These objectives will provide the Festivo team with measurable goals for evaluating the application's performance. By comparing actual SLI measurements against the established SLO targets, the team can identify performance issues and determine when corrective actions are necessary.

4. Service Level Agreements (SLAs)

Miguel Renteria, Cabrera Armando, Anaiah Quinn, Gabriel Trevino, Angel Bautista

Service Level Agreements (SLAs) are agreements between a service provider and its customers that define the expected level of service and what happens if those expectations are not met.

For Festivo, the application helps users organize events, while revenue comes from vendors and companies advertising their services and promotions on the platform. Because of this, the SLAs will mainly focus on the vendors who pay to advertise through Festivo.

4.1 Service Commitments

Festivo will use its established SLOs to determine the expected level of service. The application aims to maintain 99% availability and ensure that 95% of event information updates appear within 30 seconds.

Meeting these targets is important because vendors rely on Festivo to display their services and promotions to potential customers.

4.2 Consequences for Failing to Meet Service Levels

If Festivo fails to meet its agreed service levels, affected vendors may receive a small discount or service credit toward their advertising fees.

For example, if Festivo experiences downtime that prevents vendor advertisements from being displayed, those vendors could receive a discount on their next payment. The amount would depend on how long the issue lasted and how much it affected their advertisements.

4.3 Monitoring and Evaluation

The Festivo team will monitor the application's performance by comparing the actual results against the established SLOs. If a target is not met, the team will investigate the issue and determine whether affected vendors should receive compensation.

This will help Festivo maintain reliable service, address problems, and build trust with its vendor partners.
